**16 MARKS QUESTIONS AND ANSWERS**

**UNIT I INTRODUCTION**

**1. Define: (i) Finite Automaton (FA) (ii) Transition diagram (iii) What are the applications of automata theory?**

FA consists of a finite set of states and a set of transitions from state to state that occur on input symbols chosen from an alphabet  $\Sigma$ . Finite Automaton is denoted by a 5-tuple  $(Q, \Sigma, \delta, q_0, F)$ , where  $Q$  is the finite set of states,  $\Sigma$  is a finite input alphabet,  $q_0$  in  $Q$  is the initial state,  $F$  is the set of final states and  $\delta$  is the transition mapping function  $Q \times \Sigma \rightarrow Q$ .

Transition diagram is a directed graph in which the vertices of the graph correspond to the states of FA. If there is a transition from state  $q$  to state  $p$  on input  $a$ , then there is an arc labeled 'a' from  $q$  to  $p$  in the transition diagram.

- In compiler construction.
- In switching theory and design of digital circuits.
- To verify the correctness of a program.
- Design and analysis of complex software and hardware systems.
- To design finite state machines such as Moore and Mealy machines.

**2.. Differentiate NFA and DFA. What is  $\epsilon$ -closure of a state  $q_0$ ?**

NFA or Non Deterministic Finite Automaton is the one in which there exists many paths for a specific input from current state to next state. NFA can be used in theory of computation because they are more flexible and easier to use than DFA.

Deterministic Finite Automaton is a FA in which there is only one path for a specific input from current state to next state. There is a unique transition on each input symbol. (Write examples with diagrams).

$\epsilon$ -closure( $q_0$ ) denotes a set of all vertices  $p$  such that there is a path from  $q_0$  to  $p$  labeled  $\epsilon$ . Example :

### 3. What is a : (a) String (b) Regular language? What is a regular expression?

#### Differentiate $L^*$ and $L^+$

A string  $x$  is accepted by a Finite Automaton  $M = (Q, \Sigma, \delta, q_0, F)$  if  $\delta(q_0, x) = p$ , for some  $p$  in  $F$ . FA accepts a string  $x$  if the sequence of transitions corresponding to the symbols of  $x$  leads from the start state to accepting state.

The language accepted by  $M$  is  $L(M)$  is the set  $\{x \mid \delta(q_0, x) \text{ is in } F\}$ . A language is regular if it is accepted by some finite automaton.

A regular expression is a string that describes the whole set of strings according to certain syntax rules. These expressions are used by many text editors and utilities to search bodies of text for certain patterns etc. Definition is: Let  $\Sigma$  be an alphabet. The regular expression over  $\Sigma$  and the sets they denote are:

- i.  $\Phi$  is a r.e and denotes empty set.
- ii.  $\epsilon$  is a r.e and denotes the set  $\{\epsilon\}$
- iii. For each 'a' in  $\Sigma$ ,  $a^+$  is a r.e and denotes the set  $\{a\}$ .
- iv. If 'r' and 's' are r.e denoting the languages  $R$  and  $S$  respectively then  $(r+s)$ ,  $(rs)$  and  $(r^*)$  are r.e that denote the sets  $R \cup S$ ,  $RS$  and  $R^*$  respectively.

$L^*$  denotes Kleene closure and is given by  $L^* = \bigcup_{i=0}^{\infty} L^i$

example :  $0^* = \{\epsilon, 0, 00, 000, \dots\}$   
Language includes empty words also.

$L^+$  denotes Positive closure and is given by  $L^+ = \bigcup_{i=1}^{\infty} L^i$

example:  $0^+ = \{0, 00, 000, \dots\}$

#### 4..Construct the NFA with $\epsilon$ -transitions from the given regular expression.

- If the regular expression is in the form of  $ab$  then NFA is

- If the regular expression is in  $a+b$  form then NFA is

- If the regular expression is in  $a^*$  form then NFA is

### 5.conversion of NFA to DFA

- Draw the NFA's transition table
- Take the initial state of NFA be the initial state of DFA.
- Transit the initial state for all the input symbols.
- If new state appears transit it again and again to make all state as old state.
- All the new states are the states of the required DFA
- Draw the transition table for DFA
- Draw the DFA from the transition table.
- 

### 6.Conversion of DFA into regular expression.

Arden's theorem is used to find regular expression from the DFA.

using this theorem if the equation is of the form  $R=Q+RP$ , we can write this as  $R=QP^*$ .

- Write the equations for all the states.
- Apply Ardens theorem and eliminate all the states.
- Find the equation of the final state with only the input symbols.
- Made the simplifications if possible
- The equation obtained is the required regular expression.

## UNIT II REGULAR EXPRESSIONS

**1.i) Write a r.e to denote a language L which accepts all the strings which begin or end with either 00 or 11.**

The r.e consists of two parts:

$$L1 = (00+11) \text{ (any no of 0's and 1's)} \\ = (00+11)(0+1)^*$$

$$L2 = \text{(any no of 0's and 1's)}(00+11) \\ = (0+1)^*(00+11)$$

Hence r.e  $R = L1 + L2$

$$= [(00+11)(0+1)^*] + [(0+1)^*(00+11)]$$

**ii). Construct a r.e for the language which accepts all strings with atleast two c's over**

**the set  $\Sigma = \{c, b\}$**

$$(b+c)^* c (b+c)^* c (b+c)^*$$

**iii). Construct a r.e for the language over the set  $\Sigma = \{a, b\}$  in which total number of a's are divisible by 3**

$$(b^* a b^* a b^* a b^*)^*$$

**IV). what is: (i)  $(0+1)^*$  (ii)  $(01)^*$  (iii)  $(0+1)$  (iv)  $(0+1)^+$**

$$(0+1)^* = \{ \epsilon, 0, 1, 01, 10, 001, 101, 101001, \dots \}$$

Any combinations of 0's and 1's.

$$(01)^* = \{ \epsilon, 01, 0101, 010101, \dots \}$$

All combinations with the pattern 01.

$$(0+1) = 0 \text{ or } 1, \text{ No other possibilities.}$$

$$(0+1)^+ = \{ 0, 1, 01, 10, 1000, 0101, \dots \}$$

**v). Reg exp denoting a language over  $\Sigma = \{1\}$  having**

**(i) even length of string (ii) odd length of a string**

$$(i) \text{ Even length of string } R = (11)^*$$

$$(ii) \text{ Odd length of the string } R = 1(11)^*$$

**vi). Reg exp for:**

**(i) All strings over  $\{0,1\}$  with the substring '0101'**

**(ii) All strings beginning with '11' and ending with 'ab'**

(iii) Set of all strings over  $\{a,b\}$  with 3 consecutive b's.

(iv) Set of all strings that end with '1' and has no substring '00'

(i)  $(0+1)^* 0101(0+1)^*$

(ii)  $11(1+a+b)^* ab$

(iii)  $(a+b)^* bbb (a+b)^*$

(iv)  $(1+01)^* (10+11)^* 1$

## 2. What are the applications of Regular expressions and Finite automata

Lexical analyzers and Text editors are two applications.

Lexical analyzers: The tokens of the programming language can be expressed using regular expressions. The lexical analyzer scans the input program and separates the tokens. For eg identifier can be expressed as a regular expression as:

$(\text{letter})(\text{letter}+\text{digit})^*$

If anything in the source language matches with this reg exp then it is recognized as an identifier. The letter is  $\{A,B,C,\dots,Z,a,b,c,\dots,z\}$  and digit is  $\{0,1,\dots,9\}$ . Thus reg exp identifies token in a language.

Text editors: These are programs used for processing the text. For example UNIX text editors use the reg exp for substituting the strings such as:

$S/bbb^*/b/$

Gives the substitute a single blank for the first string of two or more blanks in a given line. In UNIX text editors any reg exp is converted to an NFA with  $\epsilon$ -transitions, this NFA can be then simulated directly.

## 3. What are the applications of pumping lemma? What is the closure property of regular sets?

Pumping lemma is used to check if a language is regular or not.

- (i) Assume that the language  $(L)$  is regular.
- (ii) Select a constant 'n'.
- (iii) Select a string  $(z)$  in  $L$ , such that  $|z| > n$ .
- (iv) Split the word  $z$  into  $u, v$  and  $w$  such that  $|uv| \leq n$  and  $|v| \geq 1$ .
- (v) You achieve a contradiction to pumping lemma that there exists an 'i' Such that  $uv^i w$  is not in  $L$ . Then  $L$  is not a regular language.

The regular sets are closed under union, concatenation and Kleene closure.

$r_1 \cup r_2 = r_1 + r_2$

$r_1.r_2 = r_1 r_2$

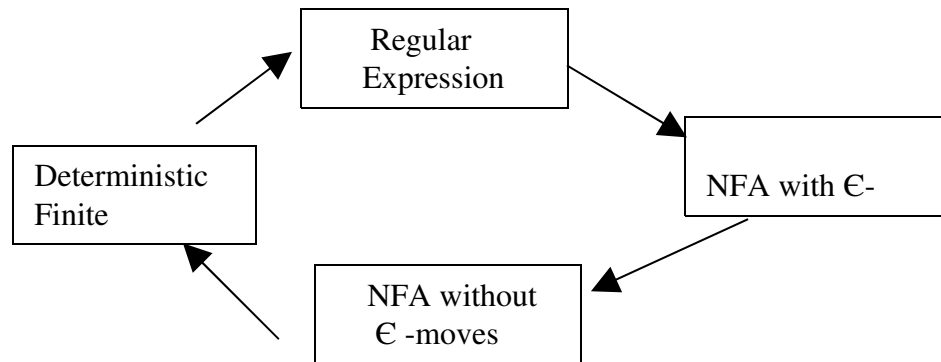

$(r)^* = r^*$

The class of regular sets are closed under complementation, substitution, homomorphism and inverse homomorphism.

## 4. Reg exp for the language such that every string will have atleast one 'a' followed by atleast one 'b'. Write the exp for the language starting with and has no consecutive b's

$R=a^+b^+$   
 reg exp= $(a+ab)^*$

**5.What is the relationship between FA and regular expression.**

### UNIT III Context Free Languages

**1. What are the applications of Context free languages?What are the uses of Context free grammars?Define a context free grammar**

Context free languages are used in:

- Defining programming languages.
- Formalizing the notion of parsing.
- Translation of programming languages.
- String processing applications.

- ❖ Construction of compilers.
- ❖ Simplified the definition of programming languages.
- ❖ Describes the arithmetic expressions with arbitrary nesting of balanced parenthesis { ( , ) }.
- ❖ Describes block structure in programming languages.
- ❖ Model neural nets.

A context free grammar (CFG) is denoted as  $G=(V,T,P,S)$  where  $V$  and  $T$  are finite set of variables and terminals respectively.  $V$  and  $T$  are disjoint.  $P$  is a finite set of productions each is of the form  $A \rightarrow \alpha$  where  $A$  is a variable and  $\alpha$  is a string of symbols from  $(V \cup T)^*$ .

## 2. What is the language generated by CFG or G? What is : (a) CFL (b) Sentential form

\*

The language generated by  $G$  ( $L(G)$ ) is  $\{w \mid w \text{ is in } T^* \text{ and } S \Rightarrow_G w\}$ . That is a string is in  $L(G)$  if:

- (1) The string consists solely of terminals.
- (2) The string can be derived from  $S$ .

$L$  is a context free language (CFL) if it is  $L(G)$  for some CFG  $G$ .

A string of terminals and variables  $\alpha$  is called a sentential form if:

\*

$S \Rightarrow \alpha$ , where  $S$  is the start symbol of the grammar.

## 3. What is : (a) derivation (b) derivation/parse tree (c) subtree

(a) Let  $G=(V,T,P,S)$  be the context free grammar. If  $A \rightarrow \beta$  is a production of  $P$  and  $\alpha$  and  $\gamma$  are any strings in  $(VUT)^*$  then  $\alpha A \gamma \Rightarrow_G \alpha \beta \gamma$ .

(b) A tree is a parse \ derivation tree for  $G$  if:

- (i) Every vertex has a label which is a symbol of  $V \cup T \cup \{\epsilon\}$ .
- (ii) The label of the root is  $S$ .
- (iii) If a vertex is interior and has a label  $A$ , then  $A$  must be in  $V$ .
- (iv) If  $n$  has a label  $A$  and vertices  $n_1, n_2, \dots, n_k$  are the sons of the vertex  $n$  in order from left with labels  $X_1, X_2, \dots, X_k$  respectively then  $A \rightarrow X_1 X_2 \dots X_k$  must be in  $P$ .
- (v) If vertex  $n$  has label  $\epsilon$ , then  $n$  is a leaf and is the only son of its father.

(c) A subtree of a derivation tree is a particular vertex of the tree together with all its descendants, the edges connecting them and their labels. The label of the root may not be the start symbol of the grammar.

## 4. What is a ambiguous grammar?. Consider the grammar $P=\{S \rightarrow aS \mid aSbS \mid \epsilon\}$ is ambiguous by constructing:

(a) two parse trees (b) two leftmost derivation (c) rightmost derivation

A grammar is said to be ambiguous if it has more than one derivation trees for a sentence or in other words if it has more than one leftmost derivation or more than one rightmost derivation.

Consider a string  $aab$  :

(a)

(b) (i)  $S \Rightarrow aS$   
 $\Rightarrow aaSbS$   
 $\Rightarrow aabS$   
 $\Rightarrow aab$

(ii)  $S \Rightarrow aSbS$   
 $\Rightarrow aaSbS$   
 $\Rightarrow aabS$   
 $\Rightarrow aab$

(c) (i)  $S \Rightarrow aS$   
 $\Rightarrow aaSbS$   
 $\Rightarrow aaSb$   
 $\Rightarrow aab$

(ii)  $S \Rightarrow aSbS$   
 $\Rightarrow aSb$   
 $\Rightarrow aaSbS$   
 $\Rightarrow aaSb$   
 $\Rightarrow aab$

5.i) Find CFG with no useless symbols equivalent to :  $S \rightarrow AB \mid CA$  ,  $B \rightarrow BC \mid AB$ ,  $A \rightarrow a$  ,  $C \rightarrow aB \mid b$ .

$S \rightarrow AB$

$S \rightarrow CA$

$B \rightarrow BC$

$B \rightarrow AB$

$A \rightarrow a$

$C \rightarrow aB$

$C \rightarrow b$  are the given productions.

\*                      \*

A symbol X is useful if  $S \Rightarrow \alpha X \beta \Rightarrow w$

The variable B cannot generate terminals as  $B \rightarrow BC$  and  $B \rightarrow AB$ .

Hence B is useless symbol and remove B from all productions.

Hence useful productions are:  $S \rightarrow CA$ ,  $A \rightarrow a$ ,  $C \rightarrow b$

ii) Construct CFG without  $\epsilon$  production from :  $S \rightarrow a \mid Ab \mid aBa$ ,  $A \rightarrow b \mid \epsilon$ ,  $B \rightarrow b \mid A$ .

$S \rightarrow a$   
 $S \rightarrow Ab$   
 $S \rightarrow aBa$

$A \rightarrow b$        $A \rightarrow \epsilon$        $B \rightarrow b$        $B \rightarrow A$  are the given set of production.

$A \rightarrow \epsilon$  is the only empty production. Remove the empty production

$S \rightarrow Ab$ , Put  $A \rightarrow \epsilon$  and hence  $S \rightarrow b$ .

If  $B \rightarrow A$  and  $A \rightarrow \epsilon$  then  $B \rightarrow \epsilon$

Hence  $S \rightarrow aBa$  becomes  $S \rightarrow aa$ .

Thus  $S \rightarrow a \mid Ab \mid b \mid aBa \mid aa$

$A \rightarrow b$

$B \rightarrow b$

Finally the productions are:  $S \rightarrow a \mid Ab \mid b \mid aBa \mid aa$

$A \rightarrow b$

$B \rightarrow b$

6. i) What are the three ways to simplify a context free grammar? What are the properties of the CFL generated by a CFG?

- ❖ By removing the useless symbols from the set of productions.
- ❖ By eliminating the empty productions.
- ❖ By eliminating the unit productions.

- ✓ Each variable and each terminal of  $G$  appears in the derivation of some word in  $L$
- ✓ There are no productions of the form  $A \rightarrow B$  where  $A$  and  $B$  are variables.

7. Find the language generated by :  $S \rightarrow 0S1 \mid 0A \mid 0 \mid 1B \mid 1$

$A \rightarrow 0A \mid 0$ ,  $B \rightarrow 1B \mid 1$  Construct the grammar

for the language  $L = \{ a^n b a^n \mid n \geq 1 \}$ .

The minimum string is  $S \rightarrow 0 \mid 1$

$S \rightarrow 0S1 \Rightarrow 001$

$S \rightarrow 0S1 \Rightarrow 011$

$S \rightarrow 0S1 \Rightarrow 00S11 \Rightarrow 000S111 \Rightarrow 0000A111 \Rightarrow 00000111$

Thus  $L = \{ 0^n 1^m \mid m \text{ not equal to } n, \text{ and } n, m \geq 1 \}$

The grammar has the production  $P$  as:

$S \rightarrow aAa$

$A \rightarrow aAa \mid b$

The grammar is thus :  $G = (\{S, A\}, \{a, b\}, P, S)$

### 8. Define Pushdown Automata. Compare NFA and PDA. Specify the two types of moves in PDA.

A pushdown Automata  $M$  is a system  $(Q, \Sigma, \Gamma, \delta, q_0, Z_0, F)$  where

$Q$  is a finite set of states.

$\Sigma$  is an alphabet called the input alphabet.

$\Gamma$  is an alphabet called stack alphabet.

$q_0$  in  $Q$  is called initial state.

$Z_0$  in  $\Gamma$  is start symbol in stack.

$F$  is the set of final states.

$\delta$  is a mapping from  $Q \times (\Sigma \cup \{\epsilon\}) \times \Gamma$  to finite subsets of  $Q \times \Gamma^*$ .

NFA	PDA
1. The language accepted by NFA is the regular language.	The language accepted by PDA is Context free language.
2. NFA has no memory.	PDA is essentially an NFA with a stack(memory).
3. It can store only limited amount of information.	It stores unbounded limit of information.
4. A language/string is accepted only by reaching the final state.	It accepts a language either by empty Stack or by reaching a final state.

The move dependent on the input symbol( $a$ ) scanned is:

$$\delta(q, a, Z) = \{ (p_1, \gamma_1), (p_2, \gamma_2), \dots, (p_m, \gamma_m) \}$$

where  $q$  and  $p$  are states,  $a$  is in  $\Sigma$ ,  $Z$  is a stack symbol and  $\gamma_i$  is in  $\Gamma^*$ .

PDA is in state  $q$ , with input symbol  $a$  and  $Z$  the top symbol on state enter state  $p_i$

Replace symbol  $Z$  by string  $\gamma_i$ .

The move independent on input symbol is ( $\epsilon$ -move):

$$\delta(q, \epsilon, Z) = \{ (p_1, \gamma_1), (p_2, \gamma_2), \dots, (p_m, \gamma_m) \}.$$

Is that PDA is in state  $q$ , independent of input symbol being scanned and with  $Z$  the top symbol on the stack enter a state  $p_i$  and replace  $Z$  by  $\gamma_i$ .

### 9. What are the different types of language acceptances by a PDA and define them.

#### Define Deterministic PDA. Define Instantaneous description(ID) in PDA.

For a PDA  $M = (Q, \Sigma, \Gamma, \delta, q_0, Z_0, F)$  we define :

❖ Language accepted by final state  $L(M)$  as:

\*

$\{ w \mid (q_0, w, Z_0) \vdash^* (p, \epsilon, \gamma) \text{ for some } p \text{ in } F \text{ and } \gamma \text{ in } \Gamma^* \}.$

❖ Language accepted by empty / null stack  $N(M)$  is:

\*

$\{ w \mid (q_0, w, Z_0) \vdash^* (p, \epsilon, \epsilon) \text{ for some } p \text{ in } Q \}.$

A PDA  $M = (Q, \Sigma, \Gamma, \delta, q_0, Z_0, F)$  is deterministic if:

- For each  $q$  in  $Q$  and  $Z$  in  $\Gamma$ , whenever  $\delta(q, \epsilon, Z)$  is nonempty, then  $\delta(q, a, Z)$  is empty for all  $a$  in  $\Sigma$ .
- For no  $q$  in  $Q$ ,  $Z$  in  $\Gamma$ , and  $a$  in  $\Sigma \cup \{ \epsilon \}$  does  $\delta(q, a, Z)$  contains more than one element.

(Eg): The PDA accepting  $\{wcw^R \mid w \text{ in } (0+1)^*\}$ .

ID describe the configuration of a PDA at a given instant. ID is a triple such as  $(q, w, \gamma)$ , where  $q$  is a state,  $w$  is a string of input symbols and  $\gamma$  is a string of stack symbols. If  $M = (Q, \Sigma, \Gamma, \delta, q_0, Z_0, F)$  is a PDA we say that

$(q, aw, Z\alpha) \vdash_M^* (p, w, \beta\alpha)$  if  $\delta(q, a, Z)$  contains  $(p, \beta)$ .

'a' may be  $\epsilon$  or an input symbol.

Example:  $(q_1, BG)$  is in  $\delta(q_1, 0, G)$  tells that  $(q_1, 011, GGR) \vdash^* (q_1, 11, BGGR)$ .

## 10. What are the closure properties of CFL? State the pumping lemma for CFLs. What is the main application of pumping lemma in CFLs?

CFL are closed under union, concatenation and Kleene closure.

CFL are closed under substitution, homomorphism.

CFL are not closed under intersection, complementation.

Closure properties of CFL's are used to prove that certain languages are not context free.

Let  $L$  be any CFL. Then there is a constant  $n$ , depending only on  $L$ , such that if  $z$  is in  $L$  and  $|z| \geq n$ , then  $z = uvwxy$  such that :

- (i)  $|vx| \geq 1$
- (ii)  $|vwx| \leq n$  and
- (iii) for all  $i \geq 0$   $uv^iwx^iy$  is in  $L$ .

The pumping lemma can be used to prove a variety of languages are not context free. Some examples are:

$L_1 = \{ a^i b^i c^i \mid i \geq 1 \}$  is not a CFL.

$L_2 = \{ a^i b^i c^i d^i \mid i \geq 1 \text{ and } j \geq 1 \}$  is not a CFL.

11. Construct CFG without  $\epsilon$  production from :  $S \rightarrow a \mid Ab \mid aBa$  ,  $A \rightarrow b \mid \epsilon$  ,  $B \rightarrow b \mid A$ .

$S \rightarrow a$

$S \rightarrow Ab$

$S \rightarrow aBa$

$A \rightarrow b$

$A \rightarrow \epsilon$

$B \rightarrow b$

$B \rightarrow A$  are the given set of production.

$A \rightarrow \epsilon$  is the only empty production. Remove the empty production

$S \rightarrow Ab$  , Put  $A \rightarrow \epsilon$  and hence  $S \rightarrow b$ .

If  $B \rightarrow A$  and  $A \rightarrow \epsilon$  then  $B \rightarrow \epsilon$

Hence  $S \rightarrow aBa$  becomes  $S \rightarrow aa$  .

Thus  $S \rightarrow a \mid Ab \mid b \mid aBa \mid aa$

$A \rightarrow b$

$B \rightarrow b$

Finally the productions are:  $S \rightarrow a \mid Ab \mid b \mid aBa \mid aa$

$A \rightarrow b$

$B \rightarrow b$

## UNIT IV Turing Machine

### 1. Construction of reduced grammar.

- Elimination of null productions
  - In a CFG, productions of the form  $A \rightarrow \epsilon$  can be eliminated, where A is a variable.
- Elimination of unit productions.
  - In a CFG, productions of the form  $A \rightarrow B$  can be eliminated, where A and B are variables.
- Elimination of Useless symbols.
  - these are the variables in CFG which does not derive any terminal or not reachable from the start symbols. These can also eliminated.

Chomsky normal form(CNF)

If the CFG is in CNF if it satisfies the following conditions

- All the production must contain only one terminal or only two variables in the right hand side.

Example: Consider G with the production of  $S \rightarrow aAB$  ,  $A \rightarrow bC$  ,  $B \rightarrow b$  ,  $C \rightarrow c$ .

G in CNF is  $S \rightarrow EB$  ,  $E \rightarrow DA$  ,  $D \rightarrow a$  ,  $A \rightarrow FC$  ,  $F \rightarrow b$  ,  $B \rightarrow b$  ,  $C \rightarrow c$ .

**2. What is a turing machine? What are the special features of TM? Define Turing machine. Define Instantaneous description of TM.**

Turing machine is a simple mathematical model of a computer. TM has unlimited and unrestricted memory and is a much more accurate model of a general purpose computer. The Turing machine is a FA with a R/W Head. It has an infinite tape divided into cells, each cell holding one symbol.

In one move, TM depending upon the symbol scanned by the tape head and state of the finite control:

- ❖ Changes state.
- ❖ Prints a symbol on the tape cell scanned, replacing what was written there.
- ❖ Moves the R/w head left or right one cell.

A Turing machine is denoted as  $M = (Q, \Sigma, \Gamma, \delta, q_0, B, F)$

$Q$  is a finite set of states.

$\Sigma$  is set of i/p symbols, not including  $B$ .

$\Gamma$  is the finite set of tape symbols.

$q_0$  in  $Q$  is called start state.

$B$  in  $\Gamma$  is blank symbol.

$F$  is the set of final states.

$\delta$  is a mapping from  $Q \times \Gamma$  to  $Q \times \Gamma \times \{L, R\}$ .

The ID of a TM  $M$  is denoted as  $\alpha_1 q \alpha_2$ . Here  $q$  is the current state of  $M$  is in  $Q$ ;  $\alpha_1 \alpha_2$  is the string in  $\Gamma^*$  that is the contents of the tape up to the rightmost nonblank symbol or the symbol to the left of the head, whichever is the rightmost.

### 3. What are the applications of TM? What is the basic difference between 2-way FA and TM? What is (a) total recursive function and (b) partial recursive function

TM can be used as:

- ❖ Recognizers of languages.
- ❖ Computers of functions on non negative integers.
- ❖ Generating devices.

Turing machine can change symbols on its tape, whereas the FA cannot change symbols on tape. Also TM has a tape head that moves both left and right side, whereas the FA doesn't have such a tape head.

If  $f(i_1, i_2, \dots, i_k)$  is defined for all  $i_1, \dots, i_k$  then we say  $f$  is a total recursive function. They are similar to recursive languages as they are computed by TM that always halt.

A function  $f(i_1, \dots, i_k)$  computed by a Turing machine is called a partial recursive function. They are similar to r.e languages as they are computed by TM that may or may not halt on a given input.

**4. Define a move in TM. What is the language accepted by TM? Give examples of total recursive functions.**

Let  $X_1 X_2 \dots X_{i-1} q X_i \dots X_n$  be an ID.

The left move is: if  $\delta(q, X_i) = (p, Y, L)$ , if  $i > 1$  then

$X_1 X_2 \dots X_{i-1} q X_i \dots X_n \vdash \dots X_1 X_2 \dots X_{i-2} p X_{i-1} Y X_{i+1} \dots X_n.$

M

The right move is if  $\delta(q, X_i) = (p, Y, R)$ , if  $i > 1$  then

$X_1 X_2 \dots X_{i-1} q X_i \dots X_n \vdash \dots X_1 X_2 \dots X_{i-1} Y p X_{i+1} \dots X_n.$

M

The language accepted by M is  $L(M)$ , is the set of words in  $\Sigma^*$  that cause M to enter a final state when placed, justified at the left on the tape of M, with M at  $q_0$  and the tape head of M at the leftmost cell. The language accepted by M is:

$\{ w \mid w \text{ in } \Sigma^* \text{ and } q_0 w \vdash \dots \alpha_1 p \alpha_2 \text{ for some } p \text{ in } F \text{ and } \alpha_1, \alpha_2 \text{ in } \Gamma^* \}.$

All common arithmetic functions on integers such as multiplication,  $n!$ ,  $\lceil \log_2 n \rceil$  and  $2^{2^n}$  are total recursive functions.

**5. What are (a) recursively enumerable languages (b) recursive sets? What are the various representation of TM? What are the possibilities of a TM when processing an input string?**

The languages that is accepted by TM is said to be recursively enumerable (r. e) languages. Enumerable means that the strings in the language can be enumerated by the TM. The class of r. e languages include CFL's.

The recursive sets include languages accepted by at least one TM that halts on all inputs.

We can describe TM using:

- ❖ Instantaneous description.
- ❖ Transition table.
- ❖ Transition diagram.

- TM can accept the string by entering accepting state.
- It can reject the string by entering non-accepting state.
- It can enter an infinite loop so that it never halts.

**6. i) What are the techniques for Turing machine construction?**

- Storage in finite control.
- Multiple tracks.

- Checking off symbols.
- Shifting over
- Subroutines.

### ii)What is the storage in FC?

The finite control(FC) stores a limited amount of information. The state of the Finite control represents the state and the second element represent a symbol scanned.

### iii)When is checking off symbols used in TM?

Checking off symbols is useful method when a TM recognizes a language with repeated strings and also to compare the length of substrings.

(eg) :  $\{ ww \mid w \in \Sigma^* \}$  or  $\{ a^i b^i \mid i \geq 1 \}$ .

This is implemented by using an extra track on the tape with symbols Blank or  $\surd$ .

### 7.i)What is a 2-way infinite tape TM?

In 2-way infinite tape TM, the tape is infinite in both directions. The leftmost square is not distinguished. Any computation that can be done by 2-way infinite tape can also be done by standard TM.

### ii)Differentiate PDA and TM.

PDA	TM
1. PDA uses a stack for storage.	1. TM uses a tape that is infinite .
2.The language accepted by PDA is CFL.	2. Tm recognizes recursively enumerable languages.

### iii).How can a TM used as a transducer?

A TM can be used as a transducer. The most obvious way to do this is to treat the entire nonblank portion of the initial tape as input , and to treat the entire blank portion of the tape when the machine halts as output. Or a TM defines a function  $y=f(x)$  for strings  $x, y \in \Sigma^*$  if:  $q_0 X \vdash^* q_f Y$ , where  $q_f$  is the final state.

### iv). What is a multi-tape Turing machine?

A multi-tape Turing machine consists of a finite control with k-tape heads and k-tapes ; each tape is infinite in both directions. On a single move depending on the state of

finite control and symbol scanned by each of tape heads, the machine can change state, print a new symbol on each cell scanned by tape head, move each of its tape head independently one cell to the left or right or remain stationary.

**v).What is a multidimensional TM?**

The device has a finite control, but the tape consists of a  $k$ -dimensional array of cells infinite in all  $2k$  directions, for some fixed  $k$ . Depending on the state and symbol scanned, the device changes state, prints a new symbol and moves its tape-head in one of the  $2k$  directions, either positively or negatively, along one of the  $k$ -axes.

**8.When a recursively enumerable language is said to be recursive? Is it true that the language accepted by a non-deterministic Turing machine is different from recursively enumerable language? What is Church's Hypothesis?**

A language  $L$  is recursively enumerable if there is a TM that accepts  $L$  and recursive if there is a TM that recognizes  $L$ . Thus r.e language is Turing acceptable and recursive language is Turing decidable languages.

No, the language accepted by non-deterministic Turing machine is same as recursively enumerable language.

The notion of computable function can be identified with the class of partial recursive functions is known as Church-hypothesis or Church-Turing thesis. The Turing machine is equivalent in computing power to the digital computer. Explain how a TM can be used to determine the given number is prime or not?

It takes a binary input greater than 2, written on the first track, and determines whether it is a prime. The input is surrounded by the symbol \$ on the first track.

To test if the input is a prime, the TM first writes the number 2 in binary on the second track and copies the first track on to the third. Then the second track is subtracted as many times as possible, from the third track effectively dividing the third track by the second and leaving the remainder.

If the remainder is zero, the number on the first track is not a prime. If the remainder is non zero, the number on the second track is increased by one. If the second track equals the first, the number on the first track is the prime. If the second is less than first, the whole operation is repeated for the new number on the second track.

## UNIT V Undecidability

**1.When we say a problem is decidable? Give an example of undecidable problem? Give examples of decidable problems. Give examples of recursive languages?**

A problem whose language is recursive is said to be decidable. Otherwise the problem is said to be undecidable. Decidable problems have an algorithm that takes as input an instance of the problem and determines whether the answer to that instance is "yes" or "no".

(eg) of undecidable problems are (1) Halting problem of the TM.

1. Given a DFSM  $M$  and string  $w$ , does  $M$  accept  $w$ ?
  2. Given a DFSM  $M$  is  $L(M) = \Phi$  ?
  3. Given two DFSMs  $M_1$  and  $M_2$  is  $L(M_1) = L(M_2)$  ?
  4. Given a regular expression  $\alpha$  and a string  $w$ , does  $\alpha$  generate  $w$ ?
  5. Given a NFSM  $M$  and string  $w$ , does  $M$  accept  $w$ ?
- 
- i. The language  $L$  defined as  $L = \{ \langle M \rangle, \langle w \rangle : M \text{ is a DFSM that accepts } w \}$  is recursive.
  - ii.  $L$  defined as  $\{ \langle M_1 \rangle \cup \langle M_2 \rangle : \text{DFSMs } M_1 \text{ and } M_2 \text{ and } L(M_1) = L(M_2) \}$  is recursive.

## 2.i) Differentiate recursive and recursively enumerable languages.

Recursive languages	Recursively enumerable languages
1. A language is said to be recursive if and only if there exists a membership algorithm for it.	1. A language is said to be r.e if there exists a TM that accepts it.
2. A language $L$ is recursive iff there is a TM that decides $L$ . (Turing decidable languages). TMs that decide languages are algorithms.	2. $L$ is recursively enumerable iff there is a TM that semi-decides $L$ . (Turing acceptable languages). TMs that semi-decides languages are not algorithms.

## ii) What are UTMs or Universal Turing machines?

Universal TMs are TMs that can be programmed to solve any problem, that can be solved by any Turing machine. A specific Universal Turing machine  $U$  is:  
 Input to  $U$ : The encoding " $\langle M \rangle$ " of a Tm  $M$  and encoding " $\langle w \rangle$ " of a string  $w$ .  
 Behavior :  $U$  halts on input " $\langle M \rangle \langle w \rangle$ " if and only if  $M$  halts on input  $w$ .

**3. What properties of recursive enumerable sets are not decidable? Define  $L_\ell$ . When is  $\ell$  a trivial property? What is a universal language  $L_u$ ? What is a Diagonalization language  $L_d$ ?**

- ❖ Emptiness
- ❖ Finiteness
- ❖ Regularity
- ❖ Context-freeness.

$L_\ell$  is defined as the set  $\{ \langle M \rangle \mid L(M) \text{ is in } \ell. \}$

$\ell$  is a trivial property if  $\ell$  is empty or it consists of all r.e. languages.

The universal language consists of a set of binary strings in the form of pairs  $(M, w)$  where  $M$  is TM encoded in binary and  $w$  is the binary input string.

$L_u = \{ \langle M, w \rangle \mid M \text{ accepts } w \}$ .

The diagonalization language consists of all strings  $w$  such that the TM  $M$  whose code is  $w$  does not accept when  $w$  is given as input.

**4. What properties of r.e. sets are recursively enumerable? What properties of r.e. sets are not r.e.? What are the conditions for  $L_\ell$  to be r.e.? What is canonical ordering? How can a TM act as a generating device?**

- ✓  $L \neq \Phi$
- ✓  $L$  contains at least 10 members.
- ✓  $w$  is in  $L$  for some fixed  $w$ .
- ✓  $L \cap L_u \neq \Phi$

- ❖  $L = \Phi$
- ❖  $L = \Sigma^*$ .
- ❖  $L$  is recursive
- ❖  $L$  is not recursive.
- ❖  $L$  is singleton.
- ❖  $L$  is a regular set.
- ❖  $L - L_u \neq \Phi$

$L_\ell$  is recursively enumerable iff  $\ell$  satisfies the following properties:

- i. If  $L$  is in  $\ell$  and  $L$  is a subset of  $L_1$ , then  $L_1$  is in  $\ell$  (containment property)
- ii. If  $L$  is an infinite language in  $\ell$ , then there is a finite subset of  $L$  in  $\ell$ .
- iii. The set of finite languages in  $\ell$  is enumerable.

Let  $\Sigma^*$  be an input set. The canonical order for  $\Sigma^*$  as follows. List words in order of size, with words of the same size in numerical order. That is let  $\Sigma = \{x_0, x_1, \dots, x_{t-1}\}$  and  $x_i$  is the digit  $i$  in base  $t$ .

(e.g) If  $\Sigma = \{a, b\}$  the canonical order is  $\epsilon, a, b, aa, ab, \dots$

In a multi-tape TM, one tape acts as an output tape, on which a symbol, once written can never be changed and whose tape head never moves left. On that output tape,  $M$  writes strings over some alphabet  $\Sigma$ , separated by a marker symbol  $\#$ ,  $G(M)$  (where  $G(M)$  is the set  $w$  in  $\Sigma^*$  such that  $w$  is finally printed between a pair of  $\#$ 's on the output device).

### 5. i) What are the different types of grammars/languages?

- Unrestricted or Phase structure grammar (Type 0 grammar) (for TMs)
- Context sensitive grammar or context dependent grammar (Type 1) (for Linear Bounded Automata)
- Context free grammar (Type 2) (for PDA)
- Regular grammar (Type 3) (for Finite Automata).

This hierarchy is called as Chomsky Hierarchy.

### ii) What is a PS or Unrestricted grammar?

A grammar without restrictions is a PS grammar. Defined as  $G = (V, T, P, S)$  With  $P$  as :

$\Phi A \Psi \rightarrow \Phi \alpha \Psi$  where  $A$  is variable and  $\Phi \alpha \Psi$  is replacement string.

The languages generated by unrestricted grammars are precisely those accepted by Turing machines.

### iii) State a single tape TM started on blank tape scans any cell four or more times is decidable?

If the TM never scans any cell four or more times, then every crossing sequence is of length at most three. There is a finite number of distinct crossing sequence of length 3 or less. Thus either TM stays within a fixed bounded number of tape cells or some crossing sequence repeats.

### 6. i) Show that AMBIGUITY problem is un-decidable.

Consider the ambiguity problem for CFGs. Use the "yes-no" version of AMB. An algorithm for FIND is used to solve AMB. FIND requires producing a word with two or more parses if one exists and answers "no" otherwise. By the reduction of AMB to FIND we conclude there is no algorithm for FIND and hence no algorithm for AMB.

**ii).State the halting problem of TMs.Define PCP or Post Correspondence Problem.Define MPCP or Modified PCP.**

The halting problem for TMs is:

Given any TM  $M$  and an input string  $w$ , does  $M$  halt on  $w$ ?

This problem is undecidable as there is no algorithm to solve this problem.

An instance of PCP consists of two lists,  $A = w_1, w_2, \dots, w_k$  and  $B = x_1, \dots, x_k$  of strings over some alphabet  $\Sigma$ . This instance of PCP has a solution if there is any sequence of integers  $i_1, i_2, \dots, i_m$  with  $m \geq 1$  such that

$$w_{i_1}, w_{i_2}, \dots, w_{i_m} = x_{i_1}, x_{i_2}, \dots, x_{i_m}$$

The sequence  $i_1, i_2, \dots, i_m$  is a solution to this instance of PCP.

The MPCP is: Given lists  $A$  and  $B$  of  $K$  strings from  $\Sigma^*$ , say

$$A = w_1, w_2, \dots, w_k \quad \text{and} \quad B = x_1, x_2, \dots, x_k$$

does there exist a sequence of integers  $i_1, i_2, \dots, i_r$  such that

$$w_{i_1} w_{i_2} \dots w_{i_r} = x_{i_1} x_{i_2} \dots x_{i_r}?$$

**7. What is the difference between PCP and MPCP? What are the concepts used in UTMs?**

The difference between MPCP and PCP is that in the MPCP, a solution is required to start with the first string on each list.

- Stored program computers.
- Interpretive Implementation of Programming languages.
- Computability.
